	\$			

\*I have my students buy \$10,000.00 for each stock they choose.

$\$10,000.00 \div$  current stock price = how many shares to buy

For example: Skechers is trading at 36.98. Students can round to the nearest dollar value. 36.98 rounded to the nearest 1 dollar is **\$37.00**

$10,000.00 \div 37 =$  **270 shares to buy**
